

# Login & Logout Check

## + Prerequisites:

- The user is connected to the internet.
- The user has accessed the application's homepage or the login page.
- The user has valid credentials (username/email and password) registered in the system.

## + Acceptance Criteria:

- As a client user I will be able to access the Practice Software Testing website, then verify login and logout functionality.
- As a client user it is mandatory to enter valid credentials in the login form to gain access.
- As a web application, the login form will validate the entered credentials against the database.
- The website will grant full access if the credentials are correct, and redirect the user to the dashboard/homepage.
- As a web application, if the credentials are invalid, the user cannot proceed. An info message will be displayed to inform the client user that the login attempt failed.
- As a web application, during login the system will record the session and associate it with the client user.
- As a client user, I should click Logout so that the system can terminate the session and redirect me back to the homepage/login page.
- In case the client user does not log out explicitly, the system should automatically expire the session after a configured timeout for security reasons.

## + Expected Results:

- This client user's credentials are verified against the database, and if valid, the user is permitted to access the website and proceed to the dashboard/homepage.
- In case the client user's credentials are invalid, a relevant info message will be displayed to inform the user that login failed, and they cannot proceed.
- The website database will record the login session for this client user to be used during the interaction and to display the correct personalized data.
- The user is redirected to the homepage/login page upon logout.
- In case the client user did not log out explicitly, the system will automatically expire the session after the timeout, and a relevant info message will be displayed to inform the user that they need to log in again.

## + Dependencies:

- User Credentials: According to the registered username/email and password, the website will validate login attempts.

- Session Management: The system will handle session creation, expiration, and termination during login and logout.
