

Shopping Cart Functionality

+ Prerequisites:

- The user is connected to the internet.
- The user has accessed the application and logged in successfully.
- The user has added one or more items to the shopping cart.

+ Acceptance Criteria:

- As a client user I will be able to access the shopping cart page and view the selected products.
- As a client user it is mandatory that products are added to the cart before accessing it with valid data displayed.
- As a web application the shopping cart page will display all selected items including product name, description, price, and quantity.
- As a web application, the user will be able to remove any product from the cart using the remove button.
- As a web application, the user will be able to continue shopping by navigating back to the products page.
- As a web application, the user will be able to proceed to checkout after reviewing the cart items.
- As a web application, if the cart is empty, the user will not be able to proceed to checkout.
- As a web application, the system will maintain the selected items in the cart until the user logs out or completes the purchase.

+ Expected Results:

- The client user is able to view all added items correctly in the shopping cart page.
- The client user can remove items and see the cart updated instantly.
- The client user can navigate back to continue shopping without losing selected items.
- The client user is able to proceed to checkout only when there are items in the cart.
- The website will correctly calculate and display product details for all items in the cart.
- The system will preserve cart data during the session.

+ Dependencies:

- Product Inventory: Items displayed in the cart depend on the available products added from the inventory page.
- User Session: The shopping cart data is linked to the active user session.
